Preface: Three Cities

I spent my high school years in Flint, Michigan, watching a great American city collapse. I now live in Lisbon, Portugal, in a nation that once commanded global empires and now watches its young people emigrate in search of opportunity. And through my co-founder Santi Siri, I have come to know Buenos Aires—a city that has experienced more economic collapses, currency crises, and system failures than most countries experience in centuries.

Three cities. Three patterns of decline. One lesson.

Buenos Aires, through Santi’s eyes and Argentina’s endless cycles, taught me that systems can fail suddenly—that the rules everyone believed in can evaporate overnight, that money in the bank can become worthless, that governments can simply take what they want. Argentina has been reset involuntarily, repeatedly, chaotically.

Flint taught me that decline can be slow, invisible until it’s irreversible. That a city can be abandoned by the economy that created it, left to poison its own children while the rest of the country looks away. Flint was reset by neglect.

Lisbon taught me that empires end, that former great powers become peripheral, that the children of colonizers can become economic refugees seeking work in their grandparents’ former colonies. Portugal is being reset by history.

These cities—and thousands like them worldwide—share a common truth: the current system is not designed to include everyone. It concentrates wealth, extracts from the periphery, and abandons what

it no longer needs. It has done this for five hundred years, since the first colonial ships set sail.

This book proposes a different kind of reset. Not the chaotic collapse that Argentina experiences every decade. Not the slow abandonment that killed Flint. Not the imperial decline that haunts Lisbon. A deliberate, coordinated, voluntary restructuring of the global economy—designed by those it left behind, implemented through technology that didn’t exist a decade ago, and scheduled for January 1, 2030.

The game is over. It’s time to reset.

A Note on “The Great Reset”

The phrase “The Great Reset” has been used before—most notably by the World Economic Forum in 2020, when founder Klaus Schwab proposed a coordinated restructuring of the global economy in response to the COVID-19 pandemic.

We use the same phrase intentionally. But our vision could not be more different.

The WEF’s Great Reset is a top-down proposal from the world’s largest corporations and wealthiest individuals—the very winners of the current game—to redesign the economy in ways they control. It is coordinated through Davos meetings, implemented through corporate pledges and government partnerships, and fundamentally preserves the power structures that created today’s inequality. It asks us to trust that those who benefited most from the old system will design a better new one.

This book proposes the opposite.

Our Great Reset is bottom-up, decentralized, and human-centric. It is not designed by billionaires meeting in Swiss ski resorts. It is designed by those the current system forgot—the people of Flint, of Buenos Aires, of Lisbon, of every place the global economy decided to abandon.

Where the WEF proposes corporate stakeholder capitalism managed by executives, we propose worker ownership accumulated through labor. Where they propose public-private partnerships controlled by institutions, we propose Commons governance controlled by verified humans. Where they propose digital identity systems managed by governments and corporations, we propose World ID—a privacy-preserving proof of personhood that no institution controls.

The WEF’s reset reinforces centralization. Ours distributes power to every human on Earth.

The WEF’s reset is a proposal. Ours is a protocol—code that runs regardless of who approves it, infrastructure that cannot be stopped once launched, rules embedded in smart contracts rather than corporate promises.

We reclaim the phrase “The Great Reset” because we believe it describes something real: the moment when accumulated inequality becomes unsustainable and the game must restart. That moment is coming whether we plan for it or not. The question is who designs the new rules—the winners of the old game, or all of us together.

January 1, 2030 is our answer.

Part I: The Game Is Over

The Monopoly Metaphor

Imagine a game of Monopoly that has been running for five hundred years. The original players—and their descendants—own everything. Every property has a hotel. Every railroad, every utility, every corner of the board generates rent for those who arrived first.

New players still join. They still receive \$200 when they pass Go. But this is meaningless when every space they land on costs thousands in rent. The money flows one direction: from new players to old players, from the unlucky to the lucky, from those who arrived late to those who arrived early.

The rules say everyone has an equal chance. The rules lie.

This is not a metaphor. This is the global economy. The board was claimed centuries ago through colonization, enclosure, and conquest. The rules were written by winners to ensure more winning. And now we pretend that the game is fair, that anyone can succeed if they just try hard enough, that the wealth of billionaires reflects their superior contribution to humanity.

What Happens When the Game Ends

But here is what everyone who has played Monopoly knows: **the game ends**. And when it ends, everything returns to the bank.

Every property deed. Every railroad. Every utility. Every hotel and house. The winner counts their cash, celebrates their victory, and then—everything goes back in the box. The board clears. The next game starts fresh.

This is not punishment. This is not theft from the winner. The winner still won. They played better, or luckier, or more ruthlessly than everyone else. They can take pride in their victory. But the game is over, and the pieces return to the bank so that the next game can begin.

This is what we have forgotten. We have been playing the same game for five hundred years without ever putting the pieces back. The winners of 1600 passed their winnings to their children, who passed them to their children, who passed them to theirs. The game never reset. The board never cleared. And now we act as if those ancient victories created permanent, hereditary claims on the earth itself.

Land titles are not natural law. They are game pieces. They were created by legal systems that humans invented, and they can be dissolved by legal systems that humans create. The land itself does not know or care who holds the paper. The earth belongs to no one and everyone. It always has.

When the Great Reset comes, the land titles return to the bank. Not to a government. Not to a corporation. To the Commons—the shared inheritance of all humanity. The game pieces go back in the box. And then, finally, we can start a game where everyone begins equal.

The Numbers

The eight richest people in the world own as much wealth as the poorest half of humanity—nearly four billion people. The richest 1% own more than the remaining 99% combined.

This is not because billionaires work harder. No one can work a billion times harder than someone else. It is because the rules of the game convert existing wealth into more wealth, while poverty perpetuates itself across generations.

- In the United States, the median Black family has one-eighth the wealth of the median white family—a ratio barely changed since the end of slavery.
- Globally, 71% of adults own less than \$10,000 in wealth, while the top 1% own 46% of all global wealth.
- The average CEO now earns 351 times what the average worker earns—up from 21 times in 1965.

These numbers are not accidents. They are the predictable results of a system designed to concentrate wealth. The game is working exactly as intended. It's just not working for most of us.

Why Resets Happen

Every human civilization has faced this moment. Wealth concentrates. The system becomes unplayable for most participants. And then, one way or another, the board clears.

Sometimes the reset is violent: revolutions, wars, collapses that destroy accumulated wealth and power. France 1789. Russia 1917. China 1949. The violence is horrific, but it achieves what no peaceful reform could—a redistribution of resources and a new beginning.

Sometimes the reset is deliberate: the Biblical Jubilee, where every fifty years debts were cancelled and land returned to original families. The Islamic prohibition on interest, which prevents the endless compounding that concentrates wealth. The Potlatch ceremonies of Pacific Northwest peoples, where status came from giving away wealth, not accumulating it.

Sometimes the reset is chaotic: Argentina's serial defaults, where the rules simply stop working and everyone scrambles to preserve what they can. The collapse of the Soviet Union. The recurring financial crises that periodically destroy wealth and require rebuilding.

We face the same choice today. We can wait for violent reset—the revolutions and wars that history suggests follow extreme inequality. We can stumble into chaotic reset—the cascading failures that come when systems are pushed past their limits. Or we can choose deliberate reset—a coordinated restructuring that preserves what works while fixing what doesn't.

This book argues for the third option. Not because violence and chaos are morally wrong (though they are), but because for the first time in history, we have the technology to coordinate a global reset without destroying everything in the process.

Part II: The Earth Belongs to Everyone

The Original Theft

No human created the earth. The land, the water, the air, the minerals beneath the ground—these existed before any of us and will exist after all of us are gone. They are the common inheritance of humanity.

Yet somehow, a small fraction of humanity claims ownership of most of the earth's surface. They did not create it. Many did not buy it fairly. It was taken—through conquest, through colonization, through legal fictions that transformed common land into private property.

The Enclosure Acts in England turned shared commons into private estates, driving peasants off land their families had farmed for generations. Colonial powers claimed entire continents as property of distant monarchs. Legal systems worldwide were designed to legitimize these thefts and make them permanent.

We are taught to accept this as natural. It is not. It is the result of specific historical choices that benefited specific people—and those choices can be unmade.

Structures vs. Earth

The Great Reset distinguishes between what humans create and what nature provides. This distinction is ancient and morally intuitive.

If you build a house, the house is yours. Your labor, your materials, your design—you created something that did not exist before. You have a legitimate claim to it.

But the land beneath the house? You did not create that. The earth was there before you arrived and will remain after you’re gone. Your claim to exclusive use of that land requires justification—and “I got here first” or “I bought it from someone who stole it” are not sufficient.

Under the Great Reset, structures remain private property. You own what you build. But land enters a new category: Commons held in trust for all humanity. You may use it—but you pay a fee to the Commons for that use. And in return, you receive your share of all fees paid worldwide.

The Hybrid Valuation System

A Commons fee requires knowing what land is worth. Previous proposals required owners to self-declare values, with the threat that anyone could buy at the declared price. This created constant instability and enabled wealthy buyers to displace less wealthy holders.

The Great Reset uses a different approach: fully automated valuation with no self-assessment and no displacement pressure.

Satellite + Algorithmic Assessment

Global satellite networks now provide weekly imagery of every parcel on Earth. Machine learning models can analyze this imagery to determine land characteristics: urban or rural, developed or vacant, fertile or barren, coastal or inland.

- Satellite imagery classifies land type, development intensity, and natural features
- Infrastructure proximity algorithms calculate distance to roads, utilities, transit, schools, hospitals
- Market data from transactions calibrates models to real-world prices
- The system updates quarterly, transparently, with all methodology published openly

Zonal Overlays

Satellite data captures physical characteristics but cannot see all value determinants. A parcel 50 meters from a subway station may look identical from space to one 500 meters away, yet differ dramatically in value.

Zonal overlays address this. Each region is divided into zones based on location premiums:

Zone Type	Multiplier	Description
Urban Core	3.0x - 5.0x	Central business districts, transit hubs
Urban General	2.0x - 3.0x	Established neighborhoods, commercial areas
Suburban	1.2x - 2.0x	Lower density, car-dependent areas
Rural Productive	0.8x - 1.2x	Active farms, managed forests
Remote/Wilderness	0.3x - 0.8x	Distant from infrastructure
Conservation	0.0x (credit)	Protected areas, rewilding zones

Zone boundaries are set through democratic governance—regional committees with public input—not by markets. They are reviewed every five years, with major infrastructure investments triggering automatic review.

Use Category Rates

The fee rate varies by how land is used:

Use Category	Rate	Rationale
Primary Residential	0.5%	Everyone needs somewhere to live
Agricultural	0.6%	Food security is a global good
Secondary Residential	0.8%	Vacation homes, not essential
Commercial/Industrial	1.0%	Standard business rate
Speculative/Vacant	2.0%	“Use it or release it”
Conservation/Rewilding	0% or -	Credits for ecosystem services

The Complete Formula

The three components combine into one transparent calculation:

Commons Fee = Base Land Value × Zone Multiplier × Use Category Rate

Example: A 0.1 hectare parcel valued at \$150,000 base, in an Urban General zone (2.5x), used as primary residence (0.5%):

$\$150,000 \times 2.5 \times 0.5\% = \$1,875$ / year

The same parcel held speculatively vacant:

$\$150,000 \times 2.5 \times 2.0\% = \$7,500$ / year

This differential creates powerful incentives to either develop productively or release land for others to use.

Universal Distribution

All Commons fees flow to a global fund. This fund is distributed equally to every verified human on Earth—a Universal Basic Income funded by the earth itself.

Conservative estimates:

- Global land value: \$200-300 trillion
- Average effective fee rate: ~0.8%
- Annual collection: \$1.6-2.4 trillion
- Per capita distribution (8 billion people): **\$200-300 per person per year**

This is a floor, not a ceiling. National and local programs can build on top of this foundation. But the baseline—a dividend from the earth to every human—is guaranteed.

When Businesses Become Utilities

Land is not the only thing that belongs to everyone.

Consider Amazon. One man—Jeff Bezos—started a company selling books online. Through brilliant strategy, relentless execution, and favorable market conditions, that company grew into something else entirely: **essential infrastructure**. Amazon is no longer merely a business. It is the logistics backbone of the global economy. It is cloud computing for half the internet. It is the default marketplace where billions of transactions occur.

Congratulations, Mr. Bezos. You won.

You played the game better than almost anyone in history. You saw opportunities others missed. You built systems of unprecedented scale and efficiency. You became one of the wealthiest humans who ever lived. You won, and no one can take that victory from you.

But here is what victory means when the game ends: The utility you created belongs to everyone.

You did not create the internet. You did not create the roads your trucks drive on. You did not create the legal system that enforces your contracts, the educated workforce that runs your warehouses, the public infrastructure that makes commerce possible. You built on top of what humanity built together—and what you built has now become part of that shared foundation.

This is not punishment. This is not theft. You keep everything you accumulated along the way—every dollar, every yacht, every mansion, every rocket ship. Your personal wealth remains yours. But the utility itself—the infrastructure that society now depends upon—that returns to the Commons, just like the land returns to the Commons.

The same principle applies to every company that has become essential infrastructure:

- **Google:** You won the search engine game. You created the map of human knowledge. Congratulations—now the map belongs to humanity.
- **Meta:** You won the social network game. You created the town square of the digital age. Congratulations—now the square belongs to everyone who gathers there.
- **Microsoft:** You won the operating system game. You created the foundation on which the digital economy runs. Congratulations—now that foundation is public infrastructure.

This is not communism. The state does not seize these companies. They transition to Commons governance—owned by the humans who use them, governed by the communities they serve, operated as public utilities rather than private fiefdoms.

The founders keep their wealth. They can start new companies, play new games, win new victories. But when a business becomes so essential that society cannot function without it, it has graduated from private enterprise to public infrastructure. It returns to the bank so the next game can begin.

How do we know when a company has become a utility? When the thought of it disappearing causes systemic panic. When governments consider it “too big to fail.” When its services are assumed as default infrastructure. When opting out is no longer a realistic choice for ordinary people.

By these measures, we already know which companies qualify. The only question is whether we have the courage to act on what we know.

Part III: Your Work Belongs to You

The Ownership Gap

If you work for a company for thirty years and retire with nothing but a pension (if you’re lucky), something is fundamentally wrong. You did not merely exchange time for money. You helped build something. You created value. You made the company what it is.

Yet under current law, workers own nothing of what they build. Shareholders—many of whom have never seen the company, never met an employee, never touched a product—own everything. Workers are inputs, like raw materials or electricity. Expendable. Interchangeable.

This was not always true. Medieval guilds ensured that craftsmen owned their tools and their trade. Family businesses passed from generation to generation. The separation of labor from ownership is a relatively recent invention—and it can be uninvented.

The Ownership Rebalance

Under the Great Reset, workers accumulate ownership in the companies where they work. Not instead of wages—in addition to them. Over time, this transforms every company into a worker-owned cooperative, gradually and without disruption.

The mechanism is simple:

- Each year, a percentage of company value is allocated to workers based on their contribution (measured by hours, wages, tenure, or some combination)
- This allocation comes from dilution of existing shares, not from company cash flow
- Workers can sell their shares, hold them, or leave them to heirs
- The percentage starts small and increases over time, ensuring gradual transition

After 20-30 years, workers own a majority of most companies. The transition is complete. No revolution was required—just recognition of what was always true: workers create value, and creators deserve to own what they create.

Part IV: Your Time Has Value

The Dignity Floor

Every human has the same 24 hours in a day. Yet the world treats our time as if it has wildly different values. An hour of a hedge fund manager's time might be worth \$10,000. An hour of a mother caring for children is worth nothing in economic terms. An hour of a subsistence farmer's time is worth pennies.

This is a moral failure. All human time has inherent value—not the same market value for every activity, but a minimum value below which no human time should fall.

TIME Protocol

TIME Protocol creates a global currency where 1 TIME token equals 1 hour of verified human work. This is not meant to replace other currencies—it exists alongside them, as a parallel system that guarantees minimum human dignity.

- Work is verified through World ID proof of personhood—one human, one identity
- TIME tokens can be exchanged for goods, services, or other currencies
- The value of TIME floats against other currencies but cannot fall below a dignity floor
- Combined with Commons dividends, TIME creates a foundation beneath which no human can fall

This is not luxury. This is security. The knowledge that your existence has value, that your time matters, that no matter what happens you will not be abandoned entirely.

Part V: To Those Who Won

If you are reading this and you are wealthy—truly wealthy, not merely comfortable—this section is for you.

You won. Congratulations.

You played the game well. You were smart, or lucky, or ruthless, or some combination. You accumulated wealth beyond anything most humans can imagine. You have yachts and jets and homes on every continent.

You won. And now the game is over.

What We Are Not Asking

The Great Reset does not ask you to give up what you have. You keep your wealth. Every dollar. Every yacht. Every private island. Every rocket company. The Reset does not confiscate your personal fortune.

What changes is simpler—and more profound:

The game pieces return to the bank.

The land beneath your properties enters the Commons. You pay fees; you also receive your per-capita share (like everyone else—your share is no larger than a factory worker's or a farmer's).

The utilities you created—the essential infrastructure that society now depends upon—transition to Commons governance. If you built Amazon, you keep your \$150 billion. But Amazon itself, the logistics backbone of the global economy, becomes public infrastructure. If you built Google, you keep your fortune. But the search engine, the map of human knowledge, belongs to humanity.

Congratulations. You won. Now hand over the utility you created for everyone.

This is what happens when Monopoly ends. The winner counts their cash, takes pride in their victory, and then the properties go back in the box. You played brilliantly. You won. And now the board clears so the next game can begin.

Your workers begin accumulating ownership in whatever enterprises continue. Your control dilutes over decades, not overnight. The endless concentration of wealth slows, then stops, then reverses.

Why You Should Join

History does not treat kindly those who cling to privilege while the world changes around them. You can fight the Reset—use your wealth and power to delay, obstruct, protect the old order. You might succeed for a while.

But consider:

- Your children will live in whatever world we create. Do you want them to inherit a fortress surrounded by an angry world, or a seat at the table of a functioning society?
- The alternative to planned Reset is unplanned collapse. The French aristocracy discovered this in 1789. They could have negotiated. They chose to resist. Their children paid the price.
- Your legacy is not measured in dollars. History will not remember your net worth. It will remember whether you helped or hindered the transition that was coming regardless.

You have more to lose from chaos than anyone. A coordinated Reset protects your personal wealth while transitioning the infrastructure to common ownership. An uncoordinated collapse protects nothing.

Join us. Help design the transition. Be remembered as someone who, when the game ended, helped start a better one.

Part VI: To Those Who Were Left Behind

If you live in Flint. If you live in the favelas of Rio. If you live in the former industrial towns of England. If you live anywhere the global economy decided to abandon—this section is for you.

You were told you failed. You didn't work hard enough. You made bad choices. You weren't smart enough.

This was a lie.

You were born into a game that was already over. The board was full before you arrived. The rules were written by winners to ensure more winning. You never had a fair chance.

The places that were left behind—the Rust Belt, the Global South, the former colonies, the abandoned neighborhoods—these are not problems to be solved. They are the proof that the current system doesn't work. They are also laboratories for what comes next.

What Changes

The Reset does not promise you wealth. It promises you a floor:

- Your share of the Commons—a dividend from the earth itself
- The value of your time—recognized and compensated through TIME Protocol
- A stake in any work you do—ownership that accumulates over time
- A voice in design—because those who were forgotten understand best what's needed

This is not charity. This is not welfare. These are rights—rights you were born with but never allowed to exercise.

Part VII: How It Happens

This book has made the case for *why* the Reset must happen. This section explains *how*—the specific protocols, systems, and infrastructure that make coordinated global restructuring possible for the first time in human history.

The Reset rests on three technological pillars, each essential, each reinforcing the others:

1. **World ID** — proving you are a unique human
2. **Land Commons Protocol** — returning the earth to everyone
3. **TIME Protocol** — recognizing the value of your time and work

Together, these create a complete system: you prove you exist, you receive your share of the earth, and your labor gains recognition and value. None requires government approval. None can be stopped once launched. Each is built on mathematics, not promises.

Pillar One: World ID — Proof of Personhood

Every system that distributes value to humans faces the same problem: how do you know a human is a human? How do you prevent one person from claiming as a thousand? This is the sybil problem, and it has defeated every previous attempt at universal distribution.

World ID solves this through biometric verification that proves you are a unique human without revealing who you are. The system uses iris scanning—not to identify you, but to generate a cryptographic proof that this iris has not registered before. Your identity remains private. Your uniqueness is verified.

This matters because every other component of the Reset depends on it. Commons dividends flow to verified humans. TIME tokens are minted by verified humans. Worker ownership accumulates to verified

humans. Without proof of personhood, any universal system becomes a playground for fraud.

World ID is not a government ID. No institution controls it. No database stores your identity. It is a proof—mathematical, verifiable, private—that you exist and are human. This proof becomes your key to the new economy.

Pillar Two: Land Commons Protocol — The Earth's Dividend

The Land Commons Protocol implements what Part II described: returning the earth to everyone while preserving private ownership of improvements.

How it works:

Every parcel of land on Earth receives an automated valuation. Satellites capture imagery. Algorithms analyze location, development, infrastructure proximity, and zonal factors. The system updates quarterly, transparently, with all methodology published openly. No human decides what your land is worth—the protocol determines it through verifiable computation.

Landholders pay a fee to the Commons based on this valuation—a percentage that varies by land type and use. Urban land in prime locations pays more. Agricultural land pays less. Conservation land may pay nothing or receive credits. The fee is not a tax in the traditional sense; it is recognition that exclusive use of the earth requires compensation to those excluded.

Where the money goes:

All Commons fees flow into a global distribution pool. This pool is divided equally among all verified humans on Earth—every person who has proven their unique existence through World ID receives an equal share.

This is the Commons Dividend: your inheritance as a human being, your share of the planet you were born onto. It is not charity. It is not welfare. It is recognition of what was always true—the earth belongs to everyone, and those who use it exclusively owe compensation to those they exclude.

The Commons Dividend is denominated in stablecoins—digital dollars or equivalent—providing immediate, spendable value. It flows directly to your wallet, automatically, without application or approval. The amount will start small and grow as more land enters the Commons and more humans verify their existence.

Pillar Three: TIME Protocol — The Value of Your Hours

TIME Protocol creates a parallel economy where human time itself becomes a recognized, tradeable asset. It operates alongside existing money, not replacing it but supplementing it—providing a floor beneath which no human labor can fall.

The core innovation:

Every verified human receives a Universal Calendar—a soulbound NFT representing their 24 hours each day. This calendar cannot be transferred or sold; it is uniquely yours, tied to your World ID verification. It represents your capacity: the hours you have available to offer.

When you work, you mint TIME tokens. One hour of verified work creates one TIME token. The token is an ERC-20 asset—fungible, tradeable, liquid. It can be exchanged for other currencies, held as savings, or used in any application that accepts it.

TIME tokens vs. Commons Dividends—two separate streams:

It is essential to understand that TIME tokens and Commons Dividends are distinct income streams serving different purposes:

	TIME Tokens	Commons Dividend
Source	Your labor—hours you work	The earth—fees paid by landholders
You must	Work and mint tokens	Simply exist and verify
Format	ERC-20 (fungible, tradeable)	Stablecoins (spendable)
Amount	Varies by hours worked	Equal share for all humans
Purpose	Recognize labor value	Recognize birthright

TIME tokens reward contribution. Commons Dividends recognize existence. Together, they create a dignity floor: even if you cannot work, you receive your share of the earth. If you can work, your time gains recognition beyond whatever the market currently pays.

Work receipts—proof of contribution:

When you complete work, you receive not just TIME tokens but also a Work Receipt NFT—a non-fungible token proving what you did, when, and for whom. These receipts accumulate into a portable, verifiable work history. They cannot be falsified. They travel with you across employers, platforms, and borders.

Over time, Work Receipts enable worker ownership. Your accumulated contributions to any enterprise become visible, verifiable, and convertible into equity stakes. This is how workers become owners—not through revolution, but through recognition of what was always true: the people who build companies deserve to own part of them.

The Technical Foundation

These three pillars share common infrastructure:

Blockchain provides the ledger—transparent, immutable, owned by no one. Every Commons fee, every TIME token, every Work Receipt is recorded permanently, verifiably, beyond the reach of any institution to alter or erase.

Smart contracts automate execution. The rules are encoded in software that runs exactly as written. No bureaucrat decides if you qualify. No institution can freeze your dividends. The code executes, and the value flows.

Cross-chain interoperability ensures the system works everywhere. Whether you're on Ethereum, World Chain, Base, or any other network, the protocols communicate. Your World ID verification, your TIME tokens, your Commons Dividend—all accessible regardless of which blockchain ecosystem you prefer.

Zero-knowledge proofs protect privacy while enabling verification. You can prove you completed work without revealing for whom. You can prove you're a unique human without revealing your identity. Privacy and accountability coexist.

The Timeline

2025-2027: Infrastructure Building

The protocols launch. Pilots begin in willing cities and regions. Early adopters verify their World ID, mint their first TIME tokens, receive their first Commons Dividends. Bugs are found and fixed. Mechanisms are refined based on real-world testing.

2027-2029: Expansion and Calibration

Successful pilots scale. Network effects accelerate adoption. Political support builds as millions experience the system's benefits. The infrastructure proves itself robust. The date approaches.

January 1, 2030: The Reset

Global launch. Land Commons Protocol activates worldwide. TIME Protocol reaches full operation. The first universal Commons Dividend distribution occurs. The game resets.

2030-2060: Transition

Grandfather provisions phase out gradually. Worker ownership stakes accumulate toward majority control. The old economy and the new economy coexist, with the new gradually absorbing the old. A new equilibrium establishes—not utopia, but a fairer starting point for the next game.

What You Can Do

Verify your humanity. Get your World ID. This is the key to everything else. Without verification, you cannot receive Commons Dividends, mint TIME tokens, or accumulate worker ownership.

Join the pilot programs. As pilots launch in cities and regions, participate. Be among the first to experience the system. Provide feedback. Help refine the mechanisms.

Spread the idea. Share this book. Discuss the concepts. The Reset works through coordination—millions of people acting together. Ideas must spread before systems can scale.

Prepare your claims. Know what you own. Document your work history. Understand what you will register on January 1, 2030.

Mark the date. January 1, 2030. Tell others. Create the expectation that something happens. Coordination requires shared anticipation.

For the Technical Reader

This book presents the philosophy and vision. The **TIME Protocol White Paper** provides complete technical specifications: smart contract architectures, tokenomics, governance mechanisms, security models, and implementation details.

If you want to understand exactly how the soulbound calendar prevents double-booking, how the land valuation algorithm works, how cross-chain messaging ensures interoperability, how zero-knowledge proofs protect privacy—the white paper awaits.

The code is open. The mechanisms are transparent. We hide nothing because we have nothing to hide. The Reset happens in daylight, with every rule visible to anyone who cares to look.

democracy.earth/whitepaper

Conclusion: The Choice

The game is over. This is not a prediction; it is a description.

What comes next is not optional. Something will change. The only question is whether the change is chosen or chaotic.

We can choose deliberate reset: clearing the board, recognizing the winners, inviting everyone to the next game with rules that prevent the same concentration from recurring.

Or we can wait for chaotic reset: the revolutions, the wars, the collapses that history suggests follow extreme inequality.

I believe we can choose. I believe we must.

The earth belongs to everyone.

Your work belongs to you.

Your time has value.

The game resets.

January 1, 2030

See you there.

About the Author

Herb Stephens spent his high school years in Flint, Michigan. He now lives in Lisbon, Portugal.

He is the co-founder of TIME Protocol, alongside Santi Siri, who co-founded Democracy Earth Foundation and pioneered blockchain democracy in Argentina. Herb was Proof of Humanity #1—the first verified human in the system.

TIME Protocol operates through a Singapore-based for-profit entity, governed by a three-member Board: Herb Stephens, Santi Siri, and Coco. This entity works in conjunction with the non-profit Democracy Earth Foundation to advance global economic justice through technological innovation.

Herb builds from places the world forgot, because he believes that's where the future begins.

Acknowledgments

Santi Siri, co-founder of Democracy Earth Foundation and pioneer of blockchain democracy, whose work in Argentina's civic tech movements and endless conversations about economic justice shaped every page of this book.

Barbara Quist Bouchard, my mother, whose unwavering support made this work possible.

Coco, fellow Board member and partner in building TIME Protocol.

The people of Flint, who taught me what abandonment looks like. The people of Buenos Aires, who taught me what resilience looks like. The people of Lisbon, who taught me what reinvention looks like.

And everyone who has been told they lost the game, when the truth is they were never allowed to play.

This book is for you.
